Project Documentation Template

Table of Contents

Introduction

Provide a brief overview of the project, its purpose, and key features.

Project Structure

Explain the directory structure and the purpose of each folder/file.

```
/itu-minitwit
       .github/
           workflows                        # GitHub Action workflows
               build-and-test.yml           # Automated build and test
               build-release.yml            # Creates release on push with a tag
               continous-deployment.yml     # Deployment to dig
               lint-and-format-check.yml    # Automated linter and formatting checks
               scheduled-release.yml        # Automated weekly release
               sonarcube.yml                # Automated Sonarcube checks
       logging/                             # Logging configuration files
                docker-compose.yml          # Starts ELK stack and nginx containers
                nginx.conf                  # Reverse proxy with authentication
       logstash/                            # Logstash configuration
       remote_files/                        # Files used remotely on the minitwit server for
       report/                              # Report files
       src/                                 # Source code
           minitwit.core/                   # Domain Layer - Domain models
           minitwit.infrastructure/         # Infrastructure Layer - Data access
           minitwit.web/                    # Presentation Layer - Web app & API entry point
               Program.cs                   # Program entrypoint
       terraform/                           # Terraform configurations for provisioning
```

```
    files/                          # Files used by terraform
    modules/
        minitwit_logging/          # Terraform code for logging infrastucture
        minitwit_server/           # Terraform code for minitwit infrastucture
    main.tf                         # Terraform module definitions
    terraform.tfvars                # Terraform variables
    variables.tf                    # Terraform variables declarations
tests/                              # Test cases
    minitwit.tests/
        minitwit.tests.cs           # API tests
        playwright.test.cs          # UI tests

docker-compose.yml                  # For running the program locally
Dockerfile                          # Application Dockerfile
itu-minitwit.sln                    # Project solution file
```

Installation

Step-by-step guide on how to set up the project locally.

```
# Clone the repository
git clone https://github.com/username/repo-name.git

# Navigate to the project directory
cd repo-name

# Install dependencies
<insert installation commands>
```

Usage

Instructions on how to run and use the project.

```
# Example command to start the project
<insert usage commands>
```

Configuration

Details about configuration files and environment variables.

Process Perspective

This perspective should clarify how code or other artifacts come from idea into the running system and everything that happens on the way.

In particular, the following descriptions should be included:

- A complete description of stages and tools included in the CI/CD chains, including deployment and release of your systems.
- How do you monitor your systems and what precisely do you monitor?
- What do you log in your systems and how do you aggregate logs?
- Brief results of the security assessment and brief description of how did you harden the security of your system based on the analysis.
- Applied strategy for scaling and upgrades.

CI/CD Chains

Our CI/CD Pipelines are built for the purpose of easier maintainess and security of our deployment to servers. ensureing that our infrastructure are up regardless of maintainess or failures for newly pushed commits.

```
/root
      workflows
          build-and-test.yml
          build-release.yml
          continous-deployment.yml
          lint-and-format-check.yml
          scheduled-release.yml
          sonarcube.yml
```

The following workflows are implemented to ensure a robust CI/CD pipeline:

1. **Build and Test Workflow**
   This workflow automates the build process and runs all unit and integration tests to ensure code quality.
2. **Build Release Workflow**
   Automatically creates a release when a new tag is pushed to the repository.
3. **Continuous Deployment Workflow**
   Deploys the application to the production server upon successful completion of tests and builds.
4. **Lint and Format Check Workflow**
   Ensures that the code adheres to the project's linting and formatting standards.
5. **Scheduled Release Workflow**
   Automates weekly releases to ensure regular updates and maintenance.
6. **SonarQube Workflow**
   Performs static code analysis using SonarQube to identify potential bugs and vulnerabilities.

Each workflow is defined in the `.github/workflows` directory and is triggered based on specific events such as pushes, pull requests, or scheduled intervals.

Deployment Chain

The deployment process follows a structured chain format to ensure reliability and minimize downtime. The steps are as follows:

1. **Linting and Code Quality Checks**
   The code is first analyzed for adherence to linting and formatting standards. This ensures that the codebase remains clean and maintainable.
2. **Integration Testing**
   Once the linting checks pass, the commit undergoes rigorous integration testing to validate that all components work together as expected.
3. **Deployment with Rolling Updates**
   If the commit successfully passes all previous stages, the deployment process begins. Rolling updates are utilized to ensure a seamless transition. This approach guarantees that if the deployment encounters any issues, an unaffected backup server remains operational to handle the workload while the problem is resolved.

This deployment strategy ensures high availability and minimizes the risk of service disruption during updates.

```
# Run tests
<insert test commands>
```

Deployment

Steps to deploy the project to production.

SystemArchitecture

```
# Dependency List:
1. Microsoft.EntityFrameworkCore.Design - Version: 9.0.1
2. Microsoft.Extensions.Configuration - Version: 9.0.2
3. Microsoft.Extensions.Configuration.EnvironmentVariables - Version: 9.0.2
4. Microsoft.Extensions.Configuration.UserSecrets - Version: 9.0.2
```

5. Npgsql.EntityFrameworkCore.PostgreSQL - Version: 9.0.4
6. prometheus-net - Version: 8.2.1
7. Serilog.AspNetCore - Version: 9.0.0
8. Serilog.Sinks.Console - Version: 6.0.0
9. Microsoft.AspNetCore.Identity - Version: 2.3.1
10. Microsoft.EntityFrameworkCore.Sqlite - Version: 9.0.1
11. Microsoft.AspNetCore.Identity.EntityFrameworkCore - Version: 9.0.1
12. Microsoft.AspNetCore.Identity.UI - Version: 9.0.1
13. Microsoft.EntityFrameworkCore.Tools - Version: 9.0.0
14. Microsoft.VisualStudio.Web.CodeGeneration.Design - Version: 9.0.0
15. prometheus-net.AspNetCore - Version: 8.2.1
16. Serilog - Version: 4.2.0
17. Serilog.Formatting.Compact - Version: 3.0.0
18. Serilog.Sinks.Elasticsearch - Version: 10.0.0
19. Serilog.Sinks.Network - Version: 2.0.2.68
20. Serilog.Sinks.Async - Version: 1.5.0
21. coverlet.collector - Version: 6.0.4
22. Microsoft.AspNetCore.Mvc.Testing - Version: 9.0.2
23. Microsoft.NET.Test.Sdk - Version: 17.13.0
24. Microsoft.Playwright.NUnit - Version: 1.50.0
25. xunit - Version: 2.9.2
26. xunit.runner.visualstudio - Version: 3.0.0
27. Postgres - Version: 16.9
28. Kibana - Version: 8.12.1
29. logstash - Version: 8.12.1
30. elasticsearch - Version: 8.12.1
31. Nginx - Version: 1.27.0
32. Dotnet_SDK - Version: 9.0.0
33. org.Sonarcube - Version: 6.1.0
